

Medical Imaging

Interventional Radiology

Mammoth Hospital Interventional Radiology physicians perform image-guided diagnostic and therapeutic procedures for cardiovascular conditions as well as a broad range of services for patients with cancer, pain, diabetes, liver, kidney, and other conditions.

Our board certified physicians specialize in minimally invasive image guided treatments. These procedures have less risk, less pain and less recovery time compared to open surgery.

Our interventionists perform innovative treatments using state-of-the-art techniques in a variety of imaging modalities including fluoroscopy, computed tomography, ultrasound and magnetic resonance imaging.

Venous Access

- Placement of PICCs (Peripherally Inserted Central Catheters)
- Placement of chest ports
- Placement and maintenance of apheresis, and infusion catheters
- Temporary central venous catheters

Dialysis access treatments

- Percutaneous Dialysis Fistula / Graft treatments
- Vascular recanalization
- Tunneled Central Venous Catheter

Chronic Renal Failure/End Stage Renal Disease

- Dialysis access planning (venography)
- Percutaneous treatment of malfunctioning or thrombosed dialysis access

Percutaneous Biopsy

- Image-guided soft tissue and bone biopsy
- Intraarticular steroid injections
- Percutaneous liver and kidney biopsy
- Transjugular liver biopsy

Gastrointestinal

- Placement and maintenance of gastrostomy and gastrojejunostomy feeding tubes
- Placement and maintenance of cecostomy tubes

Drainages

- Paracentesis
- Thoracentesis
- Percutaneous drainage of abscesses and fluid collections
- Placement of chest tubes

Obstructive Uropathy

- Nephrostomy, nephroureterostomy and ureteronephrostomy
- Ureteral stents
- Percutaneous access for stone retrieval
- Suprapubic drainage
- Biliary Intervention
- Biliary drainage (native and transplant liver)
- Cholecystostomy
- Venous Thromboembolic Disease
- Venous thrombolysis, angioplasty and stenting
